ABSTRACT

In an image processing apparatus connected with a computer which is capable of executing image processing which corresponds to an image processing command, a file format which permits addition

5 of the image processing command to image data which has been read is stored in a non-volatile memory. A CPU judges whether a determined file format is stored in the non-volatile memory, and when judging that the determined file format is stored in the non-volatile memory, the CPU permits addition of the image

10 processing command to the read image data.
